

# Takedowns

There are two ways to communicate 'take-downs', i.e. the request from a Release Creator to a DSP to stop trading a Release:

- Sending a `NewReleaseMessage` with a Deal ending today (or even yesterday); or
- Sending a `PurgeReleaseMessage`.

While the two messages were designed for different purposes (one to allow a DSP to make Releases available and to communicate changes in availability – and other other to take down Releases that have been corrupted over time), both can be used to instruct a DSP to not make available a specific Release any longer.
